

What is an Air Audit?

- A detailed report that provides the information necessary to make sound decisions on implementing air system improvements based on *facts*
- It is a review of the *entire* system from supply side - to distribution - to point of use
- It uses *data logging* to document system performance
 - Logs multiple characteristics (pressure, power, dew point, etc.) simultaneously over several days
 - Logging interval must be fast enough to address system dynamics
- Provides objective analysis with *documentation*
- Clearly identifies opportunities for improvements and provides specific *unbiased* recommendations
